INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY (SEPARATE SHEET)

IAP20 Rec a Funternational application 2006
PCT/GB2004/004391

Re Item V

Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

Reference is made to the following documents:

D1: US 5 026 927 A (M.A. Andrews, et al.) 25 June 1991D1: US 3 935 284 A (W.M. Kruse, et al.) 27 January 1976

1. Subject-matter

The present application concerns a process for the production of glycols (page 1, line 1) by hydrogenolysis of a sugar feedstock in the presence of a catalyst comprising ruthenium or osmium and an organic phosphine in the presence of water at a temperature greater than 150 °C (claim 1). This process also yields the undesired glycerol (see examples).

2. Novelty

Document D1 (claim 1) describes a method for the hydrocracking of carbohydrates (mono-, di- or pretreated polysaccharides) in the presence of ruthenium- and osmium-containing catalysts with triphenylphosphine and, optionally, other ligands. D1 indicates that the process can be carried out at a temperature of between 25 °C and 200 °C (column 3, lines 35 to 37) or more particularly between 50 °C and 150 °C (claim 10). Water can be used as the solvent (column 3, lines 15-16; claim 9; examples 2-6,8-10 and column 4, lines 16-17).

All the features of present claim 1, namely that the catalyst comprises ruthenium or osmium and an organic phosphine and that the hydrogenolysis is performed in the presence of water at a temperature of greater than 150 °C, are disclosed in D1. Thus, the subject-matter of present claim 1 constitutes in part a selection of that disclosed in D1.

What has to be established with regard to novelty is whether the state of the art is such as to make the subject-matter of the invention available to the skilled person in a technical teaching. For novelty to be established, the selected sub-range

(a) should be narrow with respect to the known range;

- (b) should be sufficiently far removed from the preferred part of the known range and must not cover any examples in the prior art; and
- (c) should not be an arbitrarily chosen specimen from the prior art, i.e. not merely one way of carrying out the prior teaching, but must provide a new invention (purposive selection).

The process in the examples of D1 is carried out using a ruthenium triphenylphosphine catalyst in N-methyl-2-pyrrolidinone as solvent, at a temperature of 100 °C (and in one case at 50 °C) and, in the case of examples 2-6,8-10, in the presence of water (in the form of a quantity of aqueous potassium hydroxide). There are no examples in D1 where it is carried out at a temperature of greater than 150 °C.

Since the presence of water has been shown to be necessary for the reaction to be carried out at the higher temperature (see paragraph 3, below), the process of claim 1, in so far as it overlaps with that of D1, appears to be a narrow selection and is not an arbitrarily chosen selection. None of the examples falls within the claimed temperature range.

Although D1 discloses carrying out the reaction in the presence of water (examples 2-6,8-10; claim 9; column 3, lines 15-16) and at a temperature greater than 150 °C (column 3, lines 35 to 37; claim 10), it is not stated or even implied that these two features are preferred, especially in conjunction with each other as in the present claim 1. Thus, it is considered that the subject-matter of present claim 1 is far removed from the preferred part of the known range.

It appears that all three of the criteria for novelty of a selection invention given above are satisfied and, consequently, the subject-matter of claim 1 and dependent claims 2-29 is considered to be novel with respect to D1.

3. Inventive step

The document D1 is regarded as being the closest prior art to the subject-matter of claim 1 and, as noted in paragraph 2 above, discloses a process for hydrocracking a mono-, di- or pretreated polysaccharide. The process of the present invention differs from that of D1 in that in the former the presence of water is required and a higher temperature is used.

PCT/GB2004/004391

The examples in D1 show that at 100 °C and 20.7 bar (300 psi) hexitols are the main product and a substantial amount of glycerol and very little ethylene glycol and propylene glycol are formed. The present application (example 59) suggests that when the hydrogenolysis is carried out at 150 °C (i.e. just below the claimed temperature range) and 69 bar (1000 psig) the conversion is low but there is some selectivity towards ethylene glycol and propylene glycol. Tables 1 and 13 show that at 190 °C, 200 °C and 225 °C, the hydrogenolysis conversion is much greater but a large amount of glycerol is still being formed and that only at 250 °C is this substantially reduced. However, the selectivity of the reaction towards glycols in the claimed temperature range (greater than 150 °C) is always better than at the lower temperatures exemplified in D1.

The problem to be solved by the present invention may therefore be regarded as the provision of an improved process for the hydrogenolysis of a sugar feedstock. The applicant solves this problem by means of the hydrogenolysis process of claim 1, in particular, carried out in the presence of water and at a temperature above 150 °C.

Document D2 discloses (column 5, lines 19-29) that in general at temperatures much above 150 °C, a ruthenium triphenyl phosphine catalyst decarbonylates the substrate and becomes inefficient. In the light of this teaching, the skilled person would not expect any improvement in the yield and selectivity of the process when carried out substantially above 150 °C even in the presence of water.

Thus, there is nothing in D1 or D2, or anywhere else in the prior art, to suggest that, in the presence of water, the use of a temperature of 150 °C or above would lead to the increased yield and increased selectivity towards glycols in the hydrogenolysis. Consequently, the subject-matter of claim 1 and of dependent claims 2-29 appears to involve an inventive step and to satisfy the requirements of Article 33(3) PCT.
